This updated and revised edition has even more information to help you understand the complexities of boating accidents. In this edition are expanded chapters on boat accident reconstruction, an entirely new chapter on personal watercraft, and sections on modern developments in steering. If you are a lawyer or an accident reconstructionist, this book will help you find appropriate data, analyze it, and determine cause and effects in a boat accident. The book is a compendium of information useful in litigation dealing with activities in and on the water. The second edition of Boat Accident Reconstruction and Litigation covers everything from the way boats function to how they are designed. It will introduce you to fluid mechanics and will explain the numerous formulae and other methods used to analyze boat accidents. It even includes an extensive series of appendices of useful Coast Guard regulations and rules.

From dirt bikes and jet skis to weed wackers and snowblowers, machines powered by small gas engines have become a permanent and loud fixture in American culture. But fifty years of high-speed fun and pristine lawns have not come without cost. In the first comprehensive history of the small-bore engine and the technology it powers, Paul R. Josephson explores the political, environmental, and public health issues surrounding one of America's most dangerous pastimes. Each chapter tells the story of an ecosystem within the United States and the devices that wreak havoc on it: personal watercraft (PWCs) on inland lakes and rivers; all-terrain vehicles (ATVs) in deserts and forests; lawn mowers and leaf blowers in suburbia. In addition to environmental impacts, Josephson discusses the development and promotion of these technologies, the legal and regulatory efforts made to improve their safety and environmental soundness, and the role of owners' clubs in encouraging responsible operation. Synthesizing information from medical journals, recent environmental research, nongovernmental organizations, and manufacturers, Josephson's compelling history leads to one irrefutable conclusion: these machines cannot be operated without loss of life and loss of habitat.
