Acute and chronic renal failure - Slideshare
Acute kidney injury, also called acute renal failure, is more commonly reversible than chronic kidney failure. Acute kidney injury (AKI) is usually caused by an event that leads to kidney malfunction, such as dehydration, blood loss from major surgery or injury, or the use of medicines. Chronic kidney disease (CKD) is usually caused by a long-term disease, such as high blood pressure or diabetes, that slowly damages the kidneys and reduces their function over time.

Acute Kidney Injury Versus Chronic Kidney Disease ...
Most babies with chronic renal failure are identified antenatally, and over half that are treated with peritoneal dialysis receive kidney transplants before school age. Most infants that develop acute renal failure have hypotension following cardiac surgery, or multiple organ failure.

The management of neonatal acute and chronic renal failure ...
RENAL CAUSES Actual damage to the nephrons and renal parenchyma characterize intrarenal failure. Clinical conditions that result in intrarenal damage can be categorized under kidney disease or acute tubular necrosis. ATN is a common type of acute renal failure in the critically ill patient. The use of nephrotoxic drugs (streptomycin, penicillin, and amphotericin) in older patients or in ...
