Abstract: Adaptive control has been recognized as an effective approach for mechanical robot manipulator controller design due to the presence of nonlinearities and uncertainties in robot dynamic models. Numerous results addressing different aspects

Adaptive control of robot manipulators - A review - IEEE ...

A new adaptive robot control algorithm is derived, which consists of a PD feedback part and a full dynamics feedforward compensation part, with the unknown manipulator and payload parameters being estimated online. The algorithm is computationally simple, because of an effective exploitation of the structure of manipulator dynamics. In particular, it requires neither feedback of

Adaptive Control of Robot Manipulators With Uncertain ...

In this paper, we mainly solve the adaptive control problem of robot manipulators with uncertain kinematics, dynamics, and actuators parameters, which has been a long-standing, yet unsolved problem in the robotics field, because of the technical difficulties in handling highly coupled effect between control torque and the mentioned uncertainties.

The adaptive robot controller design problem is as follows: given the desired trajectories $q_d(t)$, $\dot{q}_d(t)$, $\ddot{q}_d(t)$, measurements of the joint position q and velocity \dot{q} , and with some or all the manipulator parameters being unknown, derive a control law for the actuator torque τ , and an adaptation law for the unknown parameters, such that the manipulator joint position $q(t)$ closely track the ...

In this paper, an adaptive neural control based on a radial basis function neural network (RBFNN) will be proposed for robotic manipulators to achieve guaranteed tracking control and estimation. Firstly, since the measurement of joint accelerations is sensitive to the external noise, we aim to avoid using the acceleration signals directly by reformulating the robotic model.

Such a control formulation yields a controller that suppresses disturbances and tracks desired trajectories uniformly in all configurations of the manipulator. Use of a poor dynamic model with this kind of model-based decoupling and linearizing scheme, however, may result in performance that is inferior to a much simpler, fixed-gain scheme.

The robotic mechanism and its controller make a complete system. As the robotic mechanism is reconfigured, the control system has to be adapted accordingly. The need for the reconfiguration usually arises from the changing functional requirements. This book will focus on the adaptive control of robotic manipulators to address the changed conditions. The aim of the book is to summarise and introduce the state-of-the-art technologies in the field of adaptive control of robotic manipulators in order to improve the methodologies on the adaptive control of robotic manipulators.
