AISC has changed its terminology to anchor "rod" to eliminate confusion between structural bolting applications, such as those covered by the AISC and RCSC Specifications, and anchorage applications between steel members and concrete elements. This includes such issues as installed tension, slip resistance, and hole sizes, which do not apply in anchor-rod applications as they are covered for all-steel bolting applications.

bolt installation equipment has been designed with a capacity to fully tension 1-in. diameter ASTM A490 bolts when required; larger bolts will usually require special equipment and/ or effort. Additionally, bolt diameters larger than 1 in. may require larger clearances, edge distances, and spacings than are standard.

The AISC LRFD still provides method to evaluate these fasteners, mainly for review of existing old structures. Rivet steel is a mild carbon steel designated by ASTM as A502 Grade 1 ( $F_y = 28$  ksi) and grade 2 & 3 ( $F_y = 38$  ksi). The principal causes for the obsolescence of rivets have been the development of high-strength bolts and welding techniques.

The ASTM specification allows F1554 anchor rods to be supplied either straight (threaded with nut for anchorage), bent or headed. Rods up to approximately 1 in. in diameter are sometimes supplied with heads hot forged similar to a structural bolt. Thereafter, it is more common that the rods will be threaded and nutted.
