Igneous rock is divided into two major groups: intrusive rock that solidifies from underground magma, and extrusive rock formed from lava that erupts and cools on the surface. Magma is generated from mantle material at several plate tectonics situations by three types of melting: decompression melting, flux melting, or heat-induced melting.

Igneous rocks are the oldest type of rock and is a volcanic rock. It comes from deep in the earth where magma is formed. When the magma reaches the earths surface and turns into lava, it cools and turns into igneous rock. This type of rock may have crystals, air bubbles or a glassy surface. They can appear to be glassy and dense.

Introduction to Igneous Rocks

The origin of the term igneous comes from the Latin 'ignis' meaning fire. Igneous rocks and metamorphic rocks derived from igneous "parents" make up most of Earth's crust and mantle. Thus, Earth can be described as a huge mass of igneous rock covered with a thin veneer of sedimentary rock and having a relatively small iron-rich core.
