Osteoporosis, a growing epidemic among women in North America, Europe, and Japan, is a painful, costly disease that has presented a treatment challenge to healthcare professionals. Until recently, therapies have focused on agents that slow bone resorption, and have had only limited success at increasing bone mass. However, exciting new developments are on the verge of changing the treatment of this debilitating disorder. Two anabolic agents, the parathyroid hormone (PTH) and the fluoride ion, show tremendous promise as tools for building and retaining bone - with no adverse side effects. Anabolic Treatments for Osteoporosis is a comprehensive account of the latest studies that have been carried out on these two agents, and a thorough assessment of their prospects as osteoporosis therapeutics. This unique book combines basic science and up-to-date clinical data to present a complete picture of this breakthrough in the treatment of a globally significant health issue.

Many diseases, nutrients, and foods affect bone structure and bone function, and are critical for human health and happiness. Osteoporosis is the most common bone metabolic disorder in humans. Its incidence is related to poor nutrition, altered hormonal status, ageing, diminished physical activity, impaired health status and harmful pharmacotherapy. Vitamins, especially vitamin D, and calcium are historically recognized as important for bone health, whereas this book also shows that there is evidence for an association between vitamin D, calcium, bone mineral density and colorectal cancer. In addition, calcium supplements may increase the risk for cardiovascular events. In regular food patterns, milk, vegetables, herbs, fruit and omega-3 may be profitable for bone health. Eating disorders also influence bone. For example, obesity is known to promote bone disease. This book discusses the multiple mechanisms by which obesity may affect bone mass and the effect of diet-induced maternal obesity on fetal bone development, as well as the different nutritional factors that can affect adolescent bone health. In addition, anorexia nervosa treatments that may help prevent loss of bone mass are reviewed. These treatments should not only be geared towards females but also towards males.

This first-ever Surgeon General's Report on bone health and osteoporosis illustrates the large burden that bone disease places on our Nation and its citizens. Like other chronic diseases that disproportionately affect the elderly, the prevalence of bone disease and fractures is projected to increase markedly as the population ages. If these predictions come true, bone disease and fractures will have a tremendous negative impact on the future well-being of Americans. But as this report makes clear, they need not come true: by working together we can change the picture of aging in America. Osteoporosis, fractures, and other chronic diseases no longer should be thought of as an inevitable part of growing old. By focusing on prevention and lifestyle changes, including physical activity and nutrition, as well as early diagnosis and appropriate treatment, Americans can avoid much of the damaging impact of bone disease and other chronic diseases. This Surgeon General's Report brings together for the first time the scientific evidence related to the prevention, assessment, diagnosis, and treatment of bone disease. More importantly, it provides a framework for moving forward. The report will be another effective tool in educating Americans about how they can promote bone health throughout their lives. This first-ever Surgeon General's Report on bone health and osteoporosis provides much needed information on bone health, an often overlooked aspect of physical health. This report follows in the tradition of previous Surgeon Generals' reports by identifying the relevant scientific data, rigorously evaluating and summarizing the evidence, and determining conclusions.
