Agents.

In computer science, a software agent is a computer program that acts for a user or other program in a relationship of agency, which derives from the Latin *agere*: an agreement to act on one's behalf. Such "action on

This volume contains a collection of papers that provides a unique, novel and up-to-date overview of how software agents technology is being

Applied in very diverse problems in health care, ranging from community care to management of organ transplants. It also provides an introductory survey that highlights the main issues to be taken into account when deploying agents in the health care area. The intended

audience includes graduate and postgraduate students specializing in artificial intelligence and researchers interested in the application of new technologies.

Building effective and user-friendly transportation systems is one of the

big challenges for engineers in the 21st century. There is an increasing need to understand, model, and govern such systems at both, the individual and the society level. Traffic and transportation scenarios are extraordinarily appealing for Distributed Artificial Intelligence, and

Technologies

The first book to provide an integrative presentation of the issues, challenges and success of designing,

building and using agent applications. The chapters presented are written by internationally leading authorities in the field, with a general audience in mind. The result is a unique overview of agent technology applications, ranging from an introduction to the technical

reports on the results achieved in this

area, discusses the benefits (and drawbacks) that agent-based systems may bring to medical domains and society, and also provides a list of the research topics that should be tackled in the near future to make the deployment of health-care agent-based systems a reality. Current

systems represent one of the more exciting research areas in computer science. With the development of powerful personal devices, the vision of a personal agent now seems increasingly appealing too. It can even be claimed that intelligent software agents will eventually

become an essential part of Web 4.0. Software agents are finding their way into areas such as environmental security, climate change, seismic safety, epidemic prevention, detection and response, computer emergency response and human and societal dynamics. Because these are

of direct interest to the NATO Science for Peace and Security Program, a NATO Advanced Study Institute (ASI) dealing with the subject was held in Tangier, Morocco, in September 2010. This book presents the content of that ASI. This book is divided into three sections: Foundations,

Applications and Student Papers.
Subjects covered include agent
system modeling, system design and
experimentation, sensor networks,
disaster management, ehealth and
medical emergencies, management
of UAVs and agents in the grid. Agent
systems security and the application

of agents in network security are also addressed and the final section includes participant presentations. The book has been designed to be usable as a textbook - for example, in a graduate course covering software agents, agent systems and their applications - and will be of interest
