Basic Chiller Fault Guide - kateplusbrandon.com
The first thing the chiller needs to know is that there
is water flowing in the evaporator and the condenser
water loops. The chiller will not start, or should not
start, if there is inadequate flow. This is to protect the
chiller from freezing and bursting the internal heat
exchanger tubes inside these vessels. If the water
inside the tubes was too slow, it could freeze and split
the pipes.

Make sure that the chiller is running. A blown circuit breaker or fuse, loose wiring, or simply a power switch that's been put in the "off" position might be preventing the chiller from running. Determine whether the chiller is cooling. Check the temperature of the coolant at the chiller's outlet to the process.
