The order of the differential equation is the order of the highest order derivative present in the equation. Here some of the examples for different orders of the differential equation are given.  $dy/dx = 3x + 2$  , The order of the equation is 1 ( $d^2 y/dx^2 + 2 (dy/dx) + y = 0$ ). The order is 2 ( $(dy/dt) + y = kt$ ). The order is 1; First Order Differential Equation

One of the stages of solutions of differential equations is integration of functions. There are standard methods for the solution of differential equations. Should be brought to the form of the equation with separable variables x and y, and integrate the separate functions separately. To do this sometimes to be a replacement.
