This reference work provides a comprehensive overview of the field of dietary chemoprevention of cancer. It reviews the wide variety of dietary factors and mechanisms of anticarcinogenesis and antimutagenesis that have been identified in vitro and in animal and human studies. This volume covers the most recent molecular mechanism by which dietary antimutagens and anticarcinogens function, and also notes the needs for further research in this potentially important area of public health.

At the molecular level, cancer chemoprevention is characterized by the disruption of, or at least the delay of, multiple pathways and processes among the three stages of carcinogenesis: initiation, promotion, and progression.^{3,4} Chemicals or biomolecules that inhibit the initiation stage are important for the preservation of DNA in its native state and are referred to as “blocking agents” since they “block” mutagenic interactions with DNA.⁴ Blocking agents may circumvent the ...

Against Cancer. These genes correct any DNA damage that naturally happens when cells divide.

~~Predictive genetic tests for cancer risk genes - NHS~~

Stress-mediated DNA damage plays an important role in the pathogenesis and development of breast cancer in addition to estrogen-mediated DNA damage. Studying the relationship between stress-mediated and estrogen-mediated DNA damage in relation to breast cancer has been recognized as a critical provision for the chemoprevention of breast cancer.
