Chronic lymphocytic leukemia (CLL) is the most common leukemia in adults. It's a type of cancer that starts in cells that become certain white blood cells (called lymphocytes) in the bone marrow. The cancer (leukemia) cells start in the bone marrow but then go into the blood. In CLL, the leukemia cells often build up slowly.

*What Is Chronic Lymphocytic Leukemia?*

Chronic lymphocytic leukemia (CLL) is a frequent hematological neoplasm in which underlying epigenetic

## *Chronic Lymphocytic Leukemia (CLL)* Guide Book 112

The average 5-year survival rate following a diagnosis of chronic lymphocytic leukemia, or CLL, is between 50 and 80 percent, according to Healthline. Survival at the 10-year mark is around 34.8 percent for both CLL types. The prognosis of CLL is affected by several factors, notes Healthline.

Advanced age, high blood levels of beta-2-microglobulin and deleted chromosomes 17 and 11 in the leukemic cells all contribute to a poor prognosis.
