What this does is run the version of python that is the default for your environment rather than the system default. However, please note that using /usr/bin/env doesn't work with CGI scripts on the CGI server because in that environment your bash or tcsh config files (eg. .bash\_profile) are not invoked. In that case, you must explicitly use the full path to the proper script binary.

Flow profiles are classified by the slope of the channel ( $S_o$ ),  $y_n$ , and  $y_c$ . There are five slope classifications designated by the letters C, M, S, A, and H (critical, mild, steep, adverse, and horizontal) respectively. Mild (M) if  $y_n > y_c$ . Steep (S) if  $y_n < y_c$ . Critical (C) if  $y_n = y_c$ .

I have a flow that needs to send an email to the person who runs the flow but it fails after getting the profile data. The flow below is purely to test and demonstrate the problem. First I use "Get My Profile (V2) to get the user's email address, but when I get to the send email action the To box won't let me use any of the dynamic fields returned from the get my profile action (see below).

*Solved: Cannot use output from Get My Profile (V2) as input ...*

In this article I will give you an step by step overview of Linux boot process with some flowchart diagrams which can help you understand better.. Stages of Linux Boot Process (flowchart) BIOS Stage; Boot Loader Stage; Kernel Stage . 1. BIOS Stage. When the machine is powered on BIOS is the first one to be called to verify if the hardware is present in the machine and if it is functioning.

*Linux Boot Process Explained Step by Step in Detail ...*

Restrict the bandwidth going to IP address 192.168.0.30 by creating a flow on virtual network interface vnic0, then restrict its bandwidth to 50Mbps: # flowadm add-flow -l vnic0 -a remote\_ip=192.168.0.30 flow0 # flowadm set-flowprop -p maxbw=50 flow0. Restrict network traffic to TCP for a local port 443 for network interface net0:

*Oracle Solaris 11 Administration - Command Cheat Sheet ...*

Because the module command is an alias or shell function (see "Package Initialization" in module(1)). When you say source runit.sh, it's like typing the module command directly into your interactive shell. But when you say ./runit.sh, you are running a new, non-interactive shell. Non-interactive shells generally do not have the standard aliases and shell functions set up.

/etc/profile is invoked only for login shells because that is its specific purpose. If you want a command to run for interactive shells that are not login shells, and you're using bash, put it in ~/.bashrc or /etc/bash.bashrc. The purpose of the "profile" files is to contain commands that ought to be run for login shells only.

ZFS (old:Zettabyte file system) combines a file system with a volume manager.It began as part of the Sun Microsystems Solaris operating system in 2001. Large parts of Solaris - including ZFS - were published under an open source license as OpenSolaris for around 5 years from 2005, before being placed under a closed source license when Oracle Corporation acquired Sun in 2009/2010.
