A model is an abstraction of the real system, is a representation of reality. Through modeling we mimic the relevant features of the system being analyzed. A model can be represented in form of equations, diagrams or tables of data. Dynamic systems are described by differential equations.

surrogate for another system. There can be many reasons for using a model. For instance, models can enable us to study how a prospective system will work before the real system has even been built. In many cases, the cost of building and studying a model is a small fraction of the cost of experimenting with the real system.

A Brief Overview of the Data Modeling

Download Free Fundamentals Of Computer

Modeling For Polymer Processing Computer Aided Engineering For Polymer Processing

Data modeling is an abstraction process. You start with your business and user needs (i.e., what you want your application to do). Then, in the modeling process you map those needs into a structure for storing and organizing your data.
