The goal of generic model management is to reduce the amount of programming needed to solve such problems by providing a database infrastructure in which a set of high-level algebraic operators are applied to models and mappings as a whole rather than to their individual building blocks.

In this work, generic model control (GMC) controller was used to control the fluidized bed reactor temperature. It is chosen since the process model can be applied directly to formulate the GMC equation, which makes its implementation easier. GMC alone was observed to be ineffective for the temperature control of the polymerization reactor. Fuzzy logic controller (FLC) is used to solve the oscillation problem in the response by GMC.
