Acute and chronic viral hepatitis infections are serious public health threats around the world. The different infections have different epidemiology and natural his- ries, and children play important roles in each of

Read Online Hepais B Pkids

these. For example, children are important reservoirs for acute hepatitis A, childhood infections are responsible for most of the global morbidity associated with chronic hepatitis B, and perinatal transmission of hepatitis C continues to occur, even as the overall incidence of new infections wanes. Some non-A through E viral hepatitis infections are seen predominantly in infants and young children, while others have specific implications for this population. Therapeutic options for children with chronic viral hepatitis are limited when compared to those available for adults, especially for

hepatitis B, and considerations given to long-term therapy have dramatic implications when dealing with the long life expectancy of these young patients. With these issues in mind, this unique volume has been created to address the special considerations regarding viral hepatitis in children. It includes the latest information and recommendations specifically directed at the pediatric population, and highlights the knowledge gaps which will need to be filled to improve our understanding of these infections and treatment of this special group. Experienced practitioners from around the world have

contributed these reviews, incorporating the latest studies, the current recommendations, and the distinctive pediatric issues that shape clinical care, and will determine the research agenda for this field going forward.

The AAP's authoritative guide on preventing, recognizing, and treating more than 200 childhood infectious diseases. Developed by the AAP's Committee on Infectious Diseases as well as the expertise of the CDC, the FDA, and hundreds of physician contributors.

WHO estimates that in 2015, 257 million

Read Online Hepais B Pkids

people were living with chronic hepatitis B virus (HBV) infection worldwide, and that 900 000 had died from HBV infection, mostly as a result of cirrhosis or hepatocellular carcinoma. Most HBV-associated deaths among adults are secondary to infections acquired at birth or in the first five years of life. In May 2016, the World Health Assembly endorsed the Global health sector strategy on viral hepatitis, which calls for the elimination of viral hepatitis as a public health threat by 2030 (defined as a 90% reduction in incidence of new infections and a 65% reduction in mortality). Elimination of

Read Online Hepais B Pkids

HBV infection as a public health threat requires a reduction in the prevalence of hepatitis B surface antigen (HBsAg) to below 0.1% in children 5 years of age. This can be achieved through universal immunization of newborns against hepatitis B and other interventions to prevent mother-to-child transmission of HBV. These guidelines provide evidence-based guidance on the use of peripartum antiviral prophylaxis in HBsAg-positive pregnant women for the prevention of mother-to-child transmission of HBV.

In 1900, for every 1,000 babies born in the United States, 100 would die before their first birthday, often due to infectious diseases. Today, vaccines exist for many viral and bacterial diseases. The National Childhood Vaccine Injury Act, passed in 1986, was intended to bolster vaccine research and development through the federal coordination of vaccine initiatives and to provide relief to vaccine manufacturers facing financial burdens. The legislation also intended to address concerns about the safety of vaccines by instituting a compensation program,

Read Online Hepais B Pkids

setting up a passive surveillance system for vaccine adverse events, and by providing information to consumers. A key component of the legislation required the U.S. Department of Health and Human Services to collaborate with the Institute of Medicine to assess concerns about the safety of vaccines and potential adverse events, especially in children. Adverse Effects of Vaccines reviews the epidemiological, clinical, and biological evidence regarding adverse health events associated with specific vaccines covered by the National Vaccine Injury Compensation Program (VICP), including the varicella

zoster vaccine, influenza vaccines, the hepatitis B vaccine, and the human papillomavirus vaccine, among others. For each possible adverse event, the report reviews peer-reviewed primary studies, summarizes their findings, and evaluates the epidemiological, clinical, and biological evidence. It finds that while no vaccine is 100 percent safe, very few adverse events are shown to be caused by vaccines. In addition, the evidence shows that vaccines do not cause several conditions. For example, the MMR vaccine is not associated with autism or childhood diabetes. Also, the DTaP vaccine is

Read Online Hepais B Pkids

not associated with diabetes and the influenza vaccine given as a shot does not exacerbate asthma. Adverse Effects of Vaccines will be of special interest to the National Vaccine Program Office, the VICP, the Centers for Disease Control and Prevention, vaccine safety researchers and manufacturers, parents, caregivers, and health professionals in the private and public sectors.

This book presents up-to-date, practically oriented information on major topics in chronic hepatitis B. The coverage encompasses

Read Online Hepais B Pkids

epidemiology; diagnosis, including molecular methods; treatment and challenges; and the management of co-infections. Readers will also find guidance on the invasive and non-invasive assessment of fibrosis in HBV infection and the prevention of mother-to-child transmission of HBV. Management of chronic hepatitis B in children is considered separately, and emerging drugs that hold promise for the treatment of chronic HBV infection are discussed. Chronic Hepatitis B will be of high value for general practitioners and specialists in gastroenterology, infectious diseases, and
