A number of basic techniques are used in microbiology with this end in mind. • First, microorganisms must be removed from natural environments and cultured in the laboratory. This requires artificial media and surfaces on which bacteria may grow.

## LAB 4. Cultivation of Bacteria

Aseptic techniques should be used for decreasing the possibility of bacterial contamination. These techniques usually involve disinfecting working areas, decreasing the possible access by bacteria from outside air to the media and using of flames for killing bacteria that might enter the vessel when they are opened.

Take a microscope slide and place 1 or 2 loopfuls of the sample in the centre. Place a coverslip over the sample, avoiding air bubbles. Seal each edge of the coverslip in turn with a thin film of Vaseline from the warmed end of a microscope slide.

## Basic Practical Microbiology

One of the beneficial outgrowths of microbiological investigations in the laboratory has been the need to use aseptic techniques for the growth and identification of specific microorganisms. Culture techniques were derived from the necessity to rapidly grow and accurately identify potential pathogens in order to treat individuals or take appropriate steps to prevent outbreaks of disease, epidemics, or pandemics.

## Product Detail - Plant Bacteriology

Studies in microbiology are essential for the discovery of new and advanced methods for the discovery of emerging microorganisms and associated diseases and applications. Microbiology also deals with techniques for the identification of these microorganisms, their classification, and the life cycle.

Staphylococcus epidermidis grows readily on laboratory media; coagulase is not produced. Speciation is by biochemical testing. DNA restriction patterns or other molecular techniques may be needed to determine whether strains are identical.
