With reference to the section on Kendall notation, the reader will realise that the $M / M / 1$ model is a queueing model where both the distribution of customer arrivals and the distribution of service times are assumed to be exponential, and there is a single server.

M / M / 1 Model

A 1 kg party bag of peanut chocolate M&M's This classic chocolate snack has a peanut crunch and a colourful sugar shell Made with roasted peanuts and real milk chocolate all wrapped in a crispy shell Peanut M&M's are a great way to add colourful fun to desserts

In queueing theory, a discipline within the mathematical theory of probability, an M/M/1 queue represents the queue length in a system having a single server, where arrivals are determined by a Poisson process and job service times have an exponential distribution. The model name is written in Kendall's notation. The model is the most elementary of queueing models and an attractive object of study as closed-form expressions can be obtained for many metrics

M/M/1 queue - Wikipedia

These functions are not finished, for example the M/M/K algorithm assumes $K = 3$ and does something like this: `st = exprnd(mu,1,nv); st = [st; exprnd(mu,1,nv)]; st = [st; exprnd(mu,1,nv)];` with `st = service times`, eg `st(2,3) = service time for the third customer by the second worker`

negative exponential arrivals and service times with a single server. This is the most widely used queueing system in analysis as pretty much everything is known about it. M/M/1 is a good approximation for a large number of queueing systems.

Definition: A meter, or metre (symbol: m), is the base unit of length and distance in the International System of Units (SI). The meter is defined as the distance traveled by light in $1/299\,792\,458$ of a second. This definition was slightly modified in 2019 to reflect changes in the definition of the second.
