In the past, the exciter was a small DC generator coupled to the same shaft as the rotor. Therefore, when the rotor rotates this exciter produces the power for the electromagnet. Control of the exciter output is done by varying the field current of the exciter.

Excitation in Power Plant Generators: Brief Overview ...

The excitation system is the single unit in which the each alternator has its exciter in the form of generator. The centralised excitation system has two or more exciter which feeds the bus-bar. The centralised system is very cheap, but the fault in the system adversely affects the alternators in the power plant. Types of Excitation System. The excitation system is mainly classified into three ...

What is Excitation System? Definition & Types of ...

Generator excitation voltage to decrease, as the load current increases. Eventually the control system will be unable to control the Generator excitation level, and voltage instability will occur. The degree of instability is determined by the kVAr size of the capacitors, relative to the kVA size of the alternator.

The excitation system comprises of an alternator rectifier main exciter and a permanent magnet generator (PMG) pilot exciter. Both of the main and pilot exciter is driven directly from the main shaft. The main exciter has a stationary field and a rotating armature directly connected, through silicon rectifiers, to the field of the main alternator.
