Microwave & Millimeter-wave Circuits and Systems. The focus of our group is to develop circuit and antenna systems for millimeter-wave (MMW) wireless communications and sensing with dramatically improved performance over the state of the art, or which exhibit completely new functionality to enable new concepts. We do this by taking advantage of inherent characteristics in advanced materials and devices which fundamentally benefit the circuit/antenna system.

Microwaves are a form of electromagnetic radiation with wavelengths ranging from about one meter to one millimeter; with frequencies between 300 MHz (1 m) and 300 GHz (1 mm). Different sources define different frequency ranges as microwaves; the above broad definition includes both UHF and EHF (millimeter wave) bands. A more common definition in radio-frequency engineering is the range between ...

Designing and fabricating a printed circuit board (PCB) at millimeter-wave frequencies starts with the circuit material, although the choice of transmission-line technology can play quite a part in how much performance can be delivered at those high frequencies. With the ongoing consumption of RF/microwave frequencies for so many cellular and wireless communications, interest continues to grow in millimeter-wave frequencies for many short range, lower power systems, such as automotive radars ...
