Recent advances in computed tomography (CT) and magnetic resonance imaging (MRI) have dramatically transformed the practice of neurosurgery and opened the door to novel operative strategies. In Minimally Invasive Neurosurgery, recognized clinical leaders in neurosurgery and neuroradiology review the cutting-edge techniques and technologies now available and describe how minimally invasive techniques have influenced their subspecialties.

Minimally invasive spinal fusion surgery takes a revolutionary approach on tradional spinal surgery. A tradional spinal fusion surgery is a surgical procedure that is done to join 2 or more vertebrae in the spine together. Vertebrae are the small bones that sit on top of each other to make up the spine.

Minimally invasive neurosurgery utilizes small, flexible, lighted tubes called endoscopes to visualize various parts of the brain, skull base, or spinal cord through small openings. Endoscopes serve as small microscopes, magnifying critical anatomical structures so the surgeon can easily see the various diseased areas requiring repair, removal, or replacement.

Minimally invasive endoscopic surgery is commonly utilized by neurosurgeons when appropriate. Techniques such as endoscopic endonasal surgery are used in pituitary tumors, craniopharyngiomas , chordomas, and the repair of cerebrospinal fluid leaks.

Neurosurgery - Wikipedia

Minimally Invasive Neurosurgery is a technique that has been developed for the treatment of spinal conditions. It involves making smaller incisions, which results in reduced blood loss and avoids significant damage to the muscles surrounding the spine. This technique also encourages faster recovery and reduces pain after surgery.
