The origin of life is a result of a supernatural event—that is, one irretrievably beyond the descriptive powers of physics, chemistry, and other science. Life, particularly simple forms, spontaneously and readily arises from nonliving matter in short periods of time, today as in the past.

**Life - The origin of life | Britannica**

The origin of life is a long-standing and controversial subject concerned with how the first known single-cell organisms called prokaryotes probably originated in the Archean period (4–2.5 BYA) and about 3.8 BYA in the oceans when chemical composition of the ocean and the atmosphere was very different from what it is today (see Dostal et al., 2009).

In evolutionary biology, abiogenesis, or informally the origin of life, is the natural process by which life has arisen from non-living matter, such as simple organic compounds. While the details of this process are still unknown, the prevailing scientific hypothesis is that the transition from non-living to living entities was not a single event, but an evolutionary process of increasing complexity that involved molecular self-replication, self-assembly, autocatalysis, and the emergence of cell

The origin of life on Earth is a scientific problem which is not yet solved. There are many ideas, but few clear facts. Most experts agree that all life today evolved by common descent from a single primitive lifeform. It is not known how this early life form evolved, but scientists think it was a natural process which happened about 3,900 million years ago. This is in accord with the philosophy of naturalism: only natural causes are admitted. It is not known if metabolism came first or genetics
