This brief sets out on a course to distinguish three main kinds of thought that underlie scientific thinking. Current science has not agreed on an understanding of what exactly the aim of science actually is, how to understand scientific knowledge, and how such knowledge can be achieved. Furthermore, no science today also explicitly admits the fact that knowledge can be constructed in different ways and therefore every scientist should be able to recognize the form of thought that under-girds their understanding of scientific theory. In response to this, this texts seeks to answer the questions: What is science? What is (scientific) explanation? What is causality and why it matters?

Science is a way to find new knowledge. The way we think about the world constrains the aspects of it we can understand. Scientists, the author suggests, should engage in a metacognitive perspective on scientific theory that reflects not only what exists in the world, but also the way the scientist thinks about the world.

This book explores the psychological nature of forgiveness for both the subjective ego and what Jung called the objective psyche, or soul. Utilizing analytical, archetypal, and dialectical psychological approaches, the notion of forgiveness is traced from its archetypal and philosophical origins in Greek and Roman mythology through its birth and development in Judaic and Christian theology, to its modern functional character as self-help commodity, relationship remedy, and global necessity. Offering a deeper understanding of the concept of "true" forgiveness as a soul event, Sandoval reveals the transformative nature of forgiveness and the implications this notion has on the self and analytical psychology.
