Harris weaves together a unique story of the complexity of global and regional sustainability.

The ideas of neoliberalism perpetuate a disembedded and dichotomised view of economy-ecology relations. The renewed interest in climate change and sustainability attests to the lack of progress achieved by the 'sustainable development' regime and to the need for more appropriate frameworks for guiding social organisation toward ecological sustainability. This book is born of the need for a critique of current approaches to environmental policy and governance and the search for alternative sustainability frameworks. Utilising a conceptual approach based on the Polanyian concept of 'embeddedness', this book argues that the links between economic theory, neo-liberalism, and the current regime of sustainable development, have rendered 'sustainability' a discursive frame in the service of economic rather than ecological goals. In rejecting the integrity of 'environmental neo-liberalism', Paton argues there are some clear points of divergence between liberalism and neo-liberalism. She subsequently examines separately the impact on liberalism of efforts to integrate environmental concerns in order to determine if therein lies the potential for an effective reformist politics of 'ecological sustainability'.

Ecological Entanglement in the Anthropocene brings together academics, activists, and artists to explore how human and nonhuman worlds act upon and transform one another. This book examines how numerous local practices can productively gesture to actions that exceed the current predictions of impending ecological destruction, with a particular focus upon agriculture, indigeneity and aesthetics.

In a time of unprecedented transformation as society seeks to build a more sustainable future, education plays an increasingly central role in training key agents of change. This book asks how we can equip students and scholars with the capabilities to promote sustainability and how the higher education curriculum can be changed to facilitate the paradigm shift needed. Across the globe, a rising number of higher education institutions and academics are responding to these questions by transforming their own teaching and learning and their institutions' curricula. This book contributes to that development by examining in-depth case studies of innovative approaches and curriculum changes at multiple levels of the education sector. Elaborating key principles of higher education for sustainable development and identifying drivers and barriers to implementing sustainability in the curriculum, the book provides a comprehensive overview of what makes higher education for sustainable development a unique field of research and practice, as well as offering a coherent narrative of how change can be effected in it. This much-needed book is a valuable resource to inform, guide and inspire students, academics, administrators and community partners, whether experienced or new to the field, whether already committed or not to higher education for sustainable development in an age of transformation.

This book offers a collection of methods and approaches aimed at resolving some of humanity's most pressing problems on a local and global level. Many of the methods are practical, with straightforward application and demonstrated positive outcomes whilst others are more visionary. Important for transitioning to a more sustainable world, these methods allow for the constructive challenging of existing western development and governance.

Containing the proceedings of the 9th International Conference on Urban Regeneration and Sustainability this book addresses the multi-disciplinary aspects of urban planning; a result of the increasing size of cities; the amount of resources and services required and the complexity of modern society. Most of earth's population now lives in cities and the process of urbanisation still continues generating many problems deriving from the drift of the population towards them. These problems can be resolved by cities becoming efficient habitats, saving resources in a way that improves the quality and standard of living. The process however, faces a number of major challenges, related to reducing pollution, improving main transportation and infrastructure systems. New urban solutions are required to optimise the use of space and energy resources leading to improvements in the environment, i.e. reduction in air, water and soil pollution as well as efficient ways to deal with waste generation. These challenges contribute to the development of social and economic imbalances and require the development of new solutions. Large cities are probably the most complex mechanisms to manage. However, despite such complexity they represent a fertile ground for architects, engineers, city planners, social and political scientists, and other professionals able to conceive new ideas and time them according to technological advances and human requirements. The challenge of planning sustainable cities lies in considering their dynamics, the exchange of energy and matter, and the function and maintenance of ordered structures directly or indirectly, supplied and maintained by natural systems. Topics covered include: Urban strategies; Planning, development and management; Urban conservation and regeneration; The community and the city; Eco-town planning; Landscape planning and design; Environmental management; Sustainable energy and the city; Transportation; Quality of life; Waterfront development; Case studies; Architectural issues; Cultural heritage issues; Intelligent environment and emerging technologies; Planning for risk; Disaster and emergency response; Safety and security; Waste management; Infrastructure and society; Urban metabolism.

Surfing and Sustainability presents a new way of understanding the impact of surfing on the environment, society and the economy, providing important insights into the field of sustainability and arguing that the activity of surfing offers a unique opportunity to explore the ambiguity of sustainability. The book contextualises surfing within current debates on sustainability and applies these debates to an innovative theoretical framework drawn from elements of a risk society and sociotechnical transitions. The book discusses the capacity of surfing to influence behaviour, both at an individual and organisational level, exploring sustainability from a range of perspectives including industry, the charity sector, media and celebrity culture. Featuring a range of international case studies, it analyses the greening of the surf industry through topics such as ECOBOARD surfboard manufacturing, business innovation and branding, environmental activism, information technology and surf forecasting, as well as the expansion of artificial wave technology. The book also considers the future directions of surfing and how the inclusion of surfing in the 2020 Olympic Games will impact sustainability debates. This is important reading for academics and scholars, as well as undergraduate and postgraduate students working and studying in sports studies, sociology, geography, economics, psychology, marine science, coastal management and economics. It is also a valuable resource for practitioners across the globe.

Cultures of Sustainability and Wellbeing: Theories, Histories and Policies examines and assesses the interdependence between sustainability and wellbeing by drawing attention to humans as producers and consumers in a post-human age. Why wellbeing ought to be regarded as essential to sustainable development is explored first from multifocal theoretical perspectives encompassing sociology, literary criticism and socioeconomics, second in relation to institutions and policies, and third with a focus on specific case studies across the world. Wellbeing and its sustainability are defined in terms of biological and cultural diversity; stages of advancement in science and technology; notions of citizenship and agency; geopolitical scenarios and environmental conditions. Wellbeing and sustainability call for enquiries into human capacities in ontological, epistemological and practical terms. A view of sustainability that revolves around material and immaterial wellbeing is based on the assumption that life quality, comfort, happiness, security, safety always posit humans as both recipients and agents. Risk and resilience in contemporary societies define the intrinsically human ability to make and consume, to act and adapt, driving the search for and fruition of wellbeing. How to sustain the dual process of exploitation and regeneration is a task that requires integrated approaches from the sciences and the humanities, jointly tracing a worldwide cartography with clear localisations. This book will be of great interest to students and researchers interested in sustainability through conceptual and empirical approaches including social theory, literary and cultural studies, environmental economics and human ecology, urbanism and cultural geography.

This book rethinks cities' relationships to sustainable development from a cultural studies perspective with social justice as its goal. Chapter authors are optimistic that cities can achieve sustainability, but insist that cities will if participation in the effort is inclusive of all groups.
