A solar thermal system can be integrated into your existing heating system or installed as part of a renovation or new build. In the majority of cases you don't need planning permission for a solar thermal system as it's a 'permitted development'. However, it's always best to check with your local authority.

Soon after this William Bailey invented the first thermosyphon system; this development meant that hot water could be used day or night and led to the successful commercialisation of solar thermal. Since then Solar thermal technology has come a long a way, improving its efficiency through various means but the general premise hasn't changed.

The amount of hot water a solar thermal system will produce depends on the following factors: 1. The roof's aspect: Anywhere between south-east and south-west are ideal. 2. The roof's tilt: While solar thermal collectors can be installed onto a wall, the optimal tilt for solar thermal panels in the UK is between 30° and 40°. If you have a flat roof, we can include mounts to your proposal, which perfectly angle the solar thermal panels.

Solar water heating systems can achieve savings on your energy bills. Based on the results of a field trial we conducted across a range of household and system sizes, typical savings from a well-installed and properly used system are £60 a year when replacing gas heating, and £70 a year when replacing electric immersion heating.

Obviously, solar thermal systems are most productive in the summer, when there is most sunlight. You will therefore rely more on other, non-renewable energy sources during the winter months. If you are planning on adding a solar thermal system to a new build or as part of a larger refinancing job as part of a mortgage, then your payments on the money lent may be considerably lower.

Solar thermal systems can make a significant contribution to energy savings, and thus reduce the tenants' ancillary costs and the operating costs of a building. Investment in a solar energy system makes it possible to decouple the heat generation costs from the increasing oil or gas prices, at least partially.
