It covers a spectrum of equivalence testing problems of both types, ranging from a one-sample problem with normally distributed observations of fixed known variance to problems involving several dependent or independent samples and multivariate data.

testing statistical hypotheses of equivalence Equivalence tests are a variation of hypothesis tests used to draw statistical inferences from observed data. In equivalence tests, the null hypothesis is defined as an effect large enough to be deemed interesting, specified by an equivalence bound. The alternative hypothesis is any effect that is less extreme than said equivalence bound.

**Equivalence test - Wikipedia**... With a far broader perspective, Testing Statistical Hypotheses of Equivalence provides the first comprehensive treatment of statistical equivalence testing. The author addresses a spectrum of specific, two-sided equivalence testing problems, from the one-sample problem with normally distributed observations of fixed known variance to problems involving several samples and multivariate data.

**Testing Statistical Hypotheses of Equivalence**... Equivalence for the test is defined by a range of values that you specify (also called the equivalence interval). The hypotheses for the test are as follows: Null hypothesis (H 0): The difference between the means is outside your equivalence interval. The means are not equivalent. Alternative hypothesis (H 1): The difference between the means is inside your equivalence interval. The means are equivalent.
