The Burgess Shale fossils are about 505 million years old, some 20 million years younger than those from Chengjiang. In fact, the Burgess Shale and Chengjiang have considerable overlap in faunal forms.

Burgess Shale - Fossil

The Burgess Shale fossils are some of the best preserved animal fossils on the planet. The animal fossil record mostly consists of the hard parts of organisms (biomineralized structures or mineralized tissues), such as teeth, bones, exoskeltons, and shells; while soft (labile) tissues are rarely preserved long enough to become a fossil. This is because these hard tissues are more resistant to decay and erosion; are more chemically and physically stable; and are less likely to be consumed ...

The Burgess Shale is a fossil-bearing deposit exposed in the Canadian Rockies of British Columbia, Canada. It is famous for the exceptional preservation of the soft parts of its fossils. At 508 million years old, it is one of the earliest fossil beds containing soft-part imprints. The rock unit is a black shale and crops out at a number of localities near the town of Field in Yoho National Park and the Kicking Horse Pass. Another outcrop is in Kootenay National Park 42 km to the south.

Pikaia gracilens is an extinct, primitive chordate animal known from the Middle Cambrian Burgess Shale of British Columbia. Sixteen specimens are known from the Greater Phyllopod bed, where they comprised 0.03% of the community. It resembled the lancelet and perhaps swam much like an eel. Its exact phylogenetic position is unclear.
