The task of timing of market tops and bottoms is a huge challenge for investors and traders. Intuitively we look for market bottoms to buy and market tops to sell -- basically, timing the market. This book showcases a new approach that technically picks market tops and bottoms for various trends, short to long term using an innovation of the Directional Movement Index (DMI), created by pioneer master technician Welles Wilder. The innovation is named the Triple DMI System. The author's first title, *Integrating Technical Analysis for the Investor* helps the investor to integrate technical analysis for investing. This title completes the approach by helping the investor to technically time the market!

adjusted returns are an anomaly of financial market inefficiency. This outlook is misleading, since such returns only shed light on the imperfect models commonly used to measure and benchmark investment performance. In particular, using static asset pricing models to judge the performance of a dynamic investment strategy leads to flawed inferences when predicting market indicators. Market Timing and Moving Averages investigates the performance of moving average price indicators as a tactical asset allocation strategy. Glabadanidis provides a rationale for analyzing and testing the market timing and predictive power of any indicator based on past average prices and trading volume. He argues that certain trading strategies are best implemented as a dynamic asset allocation without selling short, in turn achieving the effect of an imperfect at-the-money protective put option. This work contains an empirical analysis of the performance of various versions of trading strategies based on simple moving averages.
