The Italian Regulatory Authority for Electricity Gas and Water (L'Autorità per l'energia elettrica il gas ed il Sistema Idrico, AegSI), an autonomous entity created by law, is tasked with defining uniform criteria for the setting of water tariffs. Water tariffs should be set in such a way that they provide incentives for higher investments while keeping water affordable for “vulnerable customers”.

This book offers a comprehensive framework of the current state of water resources in Italy and of the main stages of the evolutionary way in the last decades for achieving an integrated, sustainable and equitable water resources management. The main paradigms of water resources development are identified as: i) engineering and economic approach to water resources exploitation, ii) focus on pollution control and water-excess management, iii) a comprehensive approach toward a sustainable and equitable distribution of resources and effective risk reduction of water-related disasters. After a section devoted to the analysis of some historic stages in the legislation framework and the governance of water and soil, with particular reference to planning, design, building and operation of water systems, two sections deal with the estimation of water resources availability on national territory and estimation of water demands in municipal,

agricultural, industrial, ecosystem sectors. The complex problems that the Italian society has to solve in the water field and the main challenges of a changing world are discussed in the fourth section of the volume. The book will not only be useful for water professionals, but also for citizen who like to discern the key factors which delay the recognition of water as a resource for life. The description of the problems and adopted solutions could also serve as a guideline for similar situations encountered in other countries, improving the preparation of the responsible people.

The key difference between success and failure for most governance systems is adaptation, specifically the ability to resolve the existing social, cultural, economic and environmental challenges that constrain adaptation. Local, regional and national systems differ in how they are designed to organize effective participation and create innovative ideas for missions, goals, strategies and actions. They also differ in how they build the effective coalitions needed to adopt, guide and protect strategies and actions during implementation, and how to build

competence and knowledge to sustain implementation. This book presents the strategic foundations for government ' s role in fostering and adapting to societal transformation in a volatile world. It shifts the focus of the discipline from an overtly retrospective analysis to a prospective analysis, incorporating the role of foresight techniques and instruments. Above all, it stimulates debate about the practical implications of governance as an emergent future-oriented framework of public management. This challenging book aims to facilitate dialogue and discussion between academics and practitioners, and encourage advanced students to take a new perspective on Public Management during these volatile times.

This book provides the first comprehensive overview of the most important water-related issues that centre on Italy, analysed from several disciplinary perspectives – such as hydrology, economics, law, sociology, environmental sciences and policy studies – in order to promote full understanding of the challenges the country is facing and the ways it could best tackle them. Despite the misconception that Italy is a water-scarce country, is in fact quite rich in water resources. Such resources, however, are unevenly distributed over the Italian territory. Italy ' s northern regions rely on quite an abundant quantity of freshwater, whereas in the southern area water endowment is limited. Moreover, climatic differences between North and South contribute to widen the divide. This disparity has notable consequences of socio-

economic character, some of which, in turn, feed back into the environmental conditions of Italian regions: pollution, floods, landslides and droughts are among the problems affecting the country. There are numerous features of water use and consumption that distinguish Italy from other comparable countries, such as the significant role played by agriculture (a water-intensive activity), a lead position in the consumption of bottled water, lower-than-average prices of water and a far-from-optimal efficiency of waterworks. All such aspects, and many others, make Italy an essential case study.

Provides an understanding of the relationship between social-ecological systems and multilevel governance so that readers can properly deal with hydrometeorological extreme events and hazards
Based on field investigations from EU research projects, this book is

the first to devote itself to scientific and policy-related knowledge concerning climate change-induced extreme events. It depicts national and international strategies, as well as tools used to improve multilevel governance for the management of hydrometeorological risks. It also demonstrates how these strategies play out over different scales of the decision-making processes. Facing Hydrometeorological Extreme Events: A Governance Issue offers comprehensive coverage of such events as floods, droughts, coastal storms, and wind storms. It showcases real-life success stories of multilevel governance and highlights the individuals involved and the resources mobilized in the decision-making processes. The book starts by presenting a synthesis of hydrometeorological extreme events and their impacts on society. It then demonstrates how societies are organizing themselves to face these extreme events, focusing on the strategies of integration of risk

management in governance and public policy. In addition, it includes the results of several EU-funded projects such as CLIMB, STARFLOOD, and INTERREG IVB project DROP. The first book dedicated to hydrometeorological extreme events governance based on field investigations from EU research projects Offers a “ multi-hazards ” approach—mixing policy, governance, and field investigations ’ main outputs Features the results of EU-funded projects addressing hydrometeorological extreme events Part of the Hydrometeorological Extreme Events series Facing Hydrometeorological Extreme Events is an ideal book for upper-graduate students, postgraduates, researchers, scientists, and policy-makers working in the field.

There is growing interest in water accounting, why it is needed, what

benefits it brings, and equally important, how it can be put into practice. Water accounting is not a new idea, yet it is an alarmingly simple one. It is about quantifying water resources and uses of water, much like financial accounts provide information on income and expenditure. Interest in water accounting is based on the premise that ‘ We cannot plan and manage what we do not measure ’ – a statement that few would disagree with. However, given the current focus on water as a precious and limiting resource, the risks of extreme floods and droughts, and water ’ s central role in the 2030 Agenda, it is difficult to understand why so little attention is given to water accounting and to making sure we have enough water. Indeed, estimates suggest that by 2050, if we continue with our current approach to water management, global water demand will exceed supply by over 40%, which would put at risk 45% of global GDP, 52%

of the world ' s population, and 40% of grain production (WWDR, 2016). This concern is supported by the World Economic Forum that consistently ranks water crises as a top global risk (WEF, 2015).

Reports from South Africa (January 2018) suggesting that Cape Town may be the world ' s first major city to face the prospect of running out of water following severe drought, is a timely ' wake-up call ' for everyone to focus on accounting for water.

Water Law and Policy examines water management in Europe, and the difficulties and policy dilemmas involved in creating integrated water management institutions. This is the only overall assessment of the development and evolution of European Water Law and Policy. The book is unique in that it concentrates on institutional development, norms and guiding principles, implementation strategies, and public

participation mechanisms at the local level, EU level, and globally. Water is one of the most mismanaged natural resources. Failed water management policies and fragmented water management institutions can have catastrophic results, including both flooding and water scarcity. Dr. Elli Louka's book provides insights that can guide water development policies across national borders. It is a must-read for policymakers, water managers, and students who need to understand national and transnational water management.
