Wi-Fi uses radio waves to transmit information between your device and a router via frequencies. Two radio-wave frequencies can be used, depending on the amount of data being sent: 2.4 gigahertz and 5 gigahertz. What does that mean, though? Well, a hertz is just a measurement of frequency.

[How Does Wi-Fi Work? | Britannica](#)

Wi-Fi works by having a computer translate data into a radio signal via a wireless adapter and transmit it. Then a wireless router receives the signal and then transmits the data to the Internet via a wire. The process can also work in reverse, with the router sending data from the Internet to a computer via radio.

Traditional Wi-Fi extenders can only communicate with your main router, and if you set up multiple Wi-Fi extenders, they usually can't communicate with each other. However, mesh Wi-Fi units can talk to whichever unit they want in order to provide the best coverage possible to all of your devices, which is a huge benefit.

[What Are Mesh Wi-Fi Systems, and How Do They Work?](#)

Put simply, it works by using a combination of Wi-Fi discs and BT's Smart Hub 2 to create one complete 'mesh' network throughout your home. As you can see, the discs connect to the hub with the strongest signal, increasing the signal from the hub as you go about the house, and significantly reducing the chance of hitting a patchy spot.
